

## TECHNICAL DATA

AN EXCLUSIVE RADIO SHACK SERVICE TO THE EXPERIMENTER

### SP0256 NARRATOR™ SPEECH PROCESSOR

#### Features

- Natural Speech
- Stand Alone Operation with Inexpensive Support Components
- Wide Operating Voltage
- Word, Phrase, or Sentence Library, ROM Expandable
- Expandable to 491K of ROM Directly
- Simple Interface to Most Microcomputers or Microprocessors
- Supports L.P.C. Synthesis: Formant Synthesis; Allophone Synthesis

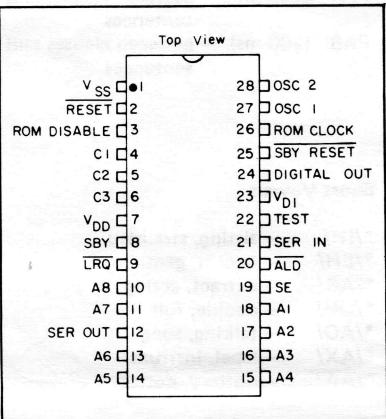

#### General Description

The SP0256 (Speech Processor) is a single chip N-Channel MOS LSI device that is able, using its stored program, to synthesize speech or complex sounds.

The achievable output is equivalent to a flat frequency response ranging from 0 to 5 kHz, a dynamic range of 42dB, and a signal to noise ratio of approximately 35dB.

The SP0256 incorporates four basic functions:

- A software programmable digital filter that can be made to model a VOCAL TRACT.
- A 16K ROM which stores both data and instructions (THE PROGRAM).
- A MICROCONTROLLER which controls the data flow from the ROM to the digital filter, the assembly of the "word strings" necessary for linking speech elements together, and the amplitude and pitch information to excite the digital filter.
- A PULSE WIDTH MODULATOR that creates a digital output which is con-

#### PIN CONFIGURATION

verted to an analog signal when filtered by an external low pass filter.

#### Allophone Based Speech Processor — SP0256-AL2

One example of a preprogrammed SP0256 is the AL2 pattern.

#### Allophone Usage with a Microprocessor

The SP0256-AL2 requires the use of a processor to concatenate the speech sounds to form words.

The SP0256 is controlled using the address pins (A1-A8), ALD (Address Load), and SE (Strobe Enable). The object for controlling the chip is to load an address into it which contains the desired allophone. The speech data for the allophone set is contained within the internal 16K ROM of the SP0256-AL2.

This particular application (Allophone Set) requires only six address pins (A1-A6) to address all the 59 allophones plus five pauses, a total of 64 locations. For simplicity, since only six address pins are needed to address the 64 locations, pins A7 and A8 can be tied low (to ground) and now any further references to the address bus will include A1-A6 and A7=A8=0.

There are two modes available for loading an address into the chip. SE (Strobe Enable) controls the mode that will be used.

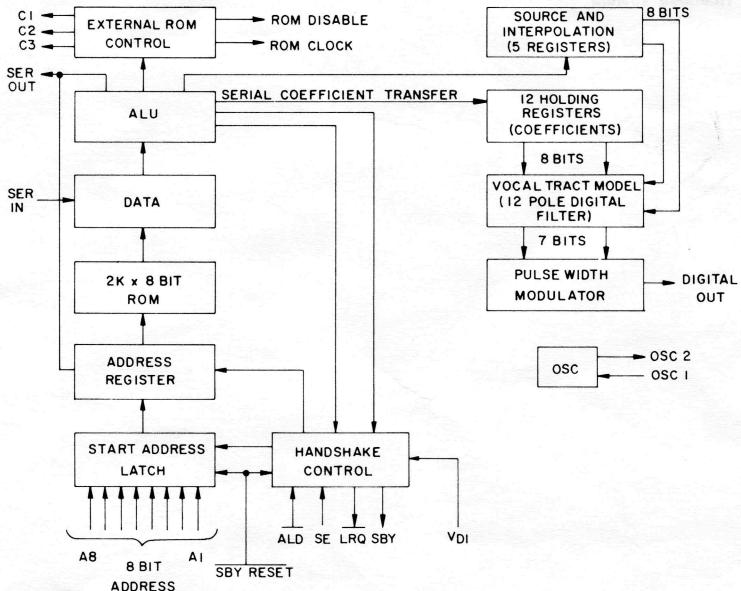

Mode 0 (SE=0) will latch an address when any one or more of the address pins makes a low to high transition. For example, to load the address one (1), A2 to A6=0 and A1 is pulsed high. To load the address twelve (12 octal), A1=A3=A5=A6=0, A2 and A4 are pulsed high simultaneously. (Note that an address of zero cannot be loaded using this mode).

Mode 1 (SE=1) will latch an address using the ALD pin. First, setup the desired address on the address bus (A1-A6)

and then pulse ALD low. Any address can be loaded using this mode, but certain setup and hold times are required (refer to the attached timing diagram for the specific times).

Two microprocessor interface pins are available for quick loading of addresses. They are LRQ and SBY. LRQ (Load Request) tells the processor when the input buffer is full. SBY (Stand By) tells the processor that the chip has stopped talking and no new address has been loaded. Either interface pin can be used when concatenating allophones. LRQ is an active low signal, when LRQ goes low it is time to load a new address to the chip. If LRQ is high, then simply wait for it to go low before loading the address. SBY will stay high until an address is loaded, then it will go low and stay low until all the internal instructions (Speech Code) from that one address are completed. Once this signal goes high, it is time to load a new address. Since speech does not require very fast address loading, it would be acceptable to use SBY to interface to the processor.

SPO256 BLOCK DIAGRAM

To end a word using allophones it is necessary to load a pause to complete the word. For example, the word "TWO"

can be implemented using the following allophones, TT2-VW2-PA1. PA1 is actually not an allophone but a pause which is needed to end the word.

## ELECTRICAL CHARACTERISTICS

### Maximum Ratings\*

All pins with respect to  $V_{SS}$  . . . . . -0.3 to 8.0V  
Storage Temperature . . . . . -25°C to 125°C

### Standard Conditions

Clock - Crystal Frequency . . . . . 3.120 MHz  
Operating Temperature ( $T_A$ ) . . . . . 0°C to 70°C

### DC CHARACTERISTICS/SPO 256

\*Exceeding these ratings could cause permanent damage to the device. This is a stress rating only and functional operation of this device at these conditions is not implied. Operating ranges are specified in Standard Conditions. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Data labeled "typical" is presented for design guidance only and is not guaranteed.

Characteristic	Sym	Min	Typ	Max	Units	Conditions

## PIN FUNCTIONS

PIN NUMBER	NAME	FUNCTION
1	V <sub>SS</sub>	Ground
2	RESET	A logic 0 resets that portion of the SP powered by V <sub>DD</sub> . Must be returned to a logic 1 for normal operation.
3	ROM DISABLE	For use with an external serial speech ROM, a logic 1 disables the external ROM.
4, 5, 6	C1, C2, C3	Output control lines for use with an external serial speech ROM. Refer to the SPR016 Data Sheet for details.
7	V <sub>DD</sub>	Power supply for all portions of the SP except the microprocessor interface logic.
8	SBY <i>STATUS 2</i>	STANDBY. A logic 1 output indicates that the SP is inactive and V <sub>DD</sub> can be powered down externally to conserve power. When the SP is reactivated by an address being loaded, SBY will go to a logic 0.
9	LRQ <i>STATUS</i>	LOAD REQUEST. LRQ is a logic 1 output whenever the input buffer is full. When LRQ goes to a logic 0, the input port may be loaded by placing the 8 address bits on A1-A8 and pulsing the ALD output.
10, 11, 13, 14, 15, 16, 17, 18	A8, A7, A6, A5, A4, A3, A2, A1	8 bit address which defines any one of 256 speech entry points.
12	SER OUT	SERIAL ADDRESS OUT. This output transfers a 16-bit address serially to an external speech ROM.
19	SE	STROBE ENABLE. Normally held in a logic 1 state. When tied to ground, ALD is disabled and the SP will automatically latch in the address on the input bus approximately 1us after detecting a logic 1 on any address line.
20	ALD	ADDRESS LOAD. A negative pulse on this input loads the 8 address bits into the input port. The negative edge of this pulse causes LRQ to go high.
21	SER IN	SERIAL IN. This is an 8-bit serial data input from an external speech ROM.

## Pin Functions Continued

PIN NUMBER	NAME	FUNCTION
22	TEST	This pin should be grounded for normal operation.
23	VD1	Power supply for the microprocessor interface logic and controller.
24	DIGITAL OUT	Pulse width modulated digital speech output which, when filtered by a 5KHz low pass filter and amplified, will drive a loudspeaker.
25	SBY RESET	STANDBY RESET. A logic 0 resets the microprocessor interface logic and the address latches. Must be returned to a logic 1 for normal operation.
26	ROM CLOCK	This is a 1.56MHz clock output used to drive an external serial speech ROM.
27	OSC1	XTAL IN. Input connection for a 3.12MHz crystal.
28	OSC2	XTAL OUT. Output connection for a 3.12MHz crystal.

## ALLOPHONE SPEECH SYNTHESIS

### Introduction

The General Instrument allophone speech synthesis technique provides the user with the ability to synthesize an unlimited vocabulary at a very low bit rate. Fifty-nine discrete speech sounds (called allophones) are five pauses are stored at different addresses in the SP0256 internal ROM. Each speech sound was excised from a word and analyzed using linear predictive coding (LPC). Any English word or phrase can be created by addressing the appropriate combination of allophones and pauses. Since there is a total of 64 address locations each requires a 6 bit address. Assuming that speech contains 10 to 12 sounds per second, allophone synthesis requires addressing less than 100 bits per second.

### Linguistics

A few basic linguistic concepts will help you start your own library of "allophone words". (See Table 1 for the General Instrument Allophone Dictionary). First, there is no one-to-one correspondence between written letters and speech sounds; secondly, speech sounds are acoustically different depending upon their position within a word; and lastly, the human ear may perceive the same acoustic signal differently in the context of different sounds.

The first point compares to the problem that a child encounters when learning to read. Each sound in a language may be represented by more than one letter and, conversely each letter may represent more than one sound. (See the examples in Table 2.) Because of these spelling irregularities, it is necessary to think in terms of **sounds**, not letters, when using allophones.

The second, and equally important, point to understand, is that the acoustic signal of a speech sound may differ depending upon its position within a word. For example, the initial K sound in **coop** will be acoustically different from the K's in **keep** and **speak**. The K's in **coop** and **keep** differ due to the influence of the vowels which follow them, and the final K in **speak** is usually not as loud as initial K's.

Finally, a listener may identify the same acoustic signal differently depending on the context in which it is perceived. Don't be surprised, therefore, if an allophone word sounds slightly different when used in various phrases.

### Phonemes Of English

The sounds of a language are called phonemes, and each language has a set which is slightly different from that of other languages. Table 3 contains a chart of all the consonant phonemes of English, Table 4 all the vowel phonemes.

Consonants are produced by creating an occlusion or constriction in the vocal tract which produces an aperiodic sound source. If the vocal cords are vibrating at the same time, as in the case of the voiced fricatives VV, DH, ZZ, and ZH, (See Table 5) there are two sound sources: one which is aperiodic and one which is periodic.

Vowels are usually produced with a relatively open vocal tract and a periodic sound source provided by the vibrating vocal cords. They are classified according to whether the front or back of the tongue is high or low (See Table 4) whether they are long or short, and whether the lips are rounded or unrounded. In English all rounded vowels are produced in or near the back of the mouth (UW, UH, OW, AO, OR, AW).

Speech sounds which have features in common behave in similar ways. For example, the voiceless stop consonants PP, TT, and KK (See Table 3) should be preceded by 50-80 msec of silence, and the voiced stop consonants BB, DD, and GG by 10-30 msec of silence.

### Allophones

Phoneme is the name given to a group of similar sounds in a language. Recall that a phoneme is acoustically different depending upon its position within a word. Each of these positional variants is an allophone of the same phoneme. An allophone, therefore, is the manifestation of a phoneme in true speech signal. It is for this reason that our inventory of English speech sounds is called an allophone set.

### How To Use The Allophone Set

(See Table 1 for instructions on how to create all the sample words mentioned in this section.) The allophone set (Refer to Table 5) contains two or three versions of some phonemes. It may be necessary to use one allophone of a particular phoneme for word-or-syllable-final position. A detailed set of guidelines for using the allophones is given in Table 5. Note that these are suggestions, not rules.

For example, DD2 sounds good in initial position and DD1 sounds good in final position, as in "daughter" and "collide". One of the differences between the initial and final versions of a consonant is that an initial version may be longer than the final version. Therefore, to create an initial SS, you can use two SSs instead of the usual single SS at the end of a word or syllable, as in "sister". Note that this can be done with TH, and FF, and the inherently short vowels (to be discussed below), but with no other consonants. You will want to experiment with some consonants such as str, cl) to discover which version works best in the cluster. For example, KK1 sounds good before LL as in "clown", and KK2 sounds good before WW as in "square". One allophone of a particular phoneme may sound better before or after back vowels and another before or after front vowels. KK3 sounds good before UH and KK1 sounds good before IY, as in "cookie". Some sounds (PP, BB, TT, DD, KK, GG, CH, and JH) require a brief duration of silence before them. For most of these, the silence has already been added but you may decide you want to add more. Therefore there are several pauses included in the

allophone set varying from 10-200 msec. To create the final sounds in the words "letter" and "little" use the allophones ER and EL.

Remember that you must always think about how a word **sounds**, not how it is spelled. For example, the NG sound is represented by the letter N in "uncle". And remember that some sounds may not even be represented in words by any letters, as the YY in "computer".

As mentioned earlier there are some vowels which can be doubled to make longer versions for stressed syllables. These are the inherently short vowels IH, EH, AE, AX, AA, and UH. For example, in the word "extent" use one EH in the first syllable, which is unstressed and two EHs in the second syllable which is stressed. Of the inherently long vowels there is one, UW, which has a long and

short version. The short one, UW1, sounds good after YY in computer. The long version, UW2, sounds good in monosyllabic words like "two". Included in the vowel set is a group called R-colored vowels. These are vowel + R combinations. For example, the AR in "alarm" and the OR in "score". Of the R-colored vowels there is one, ER, which has a long and short version. The short version is good for polysyllabic words with final ER sounds like "letter", and the long version is good for monosyllabic words like "fir". One final suggestion is that you may want to add a pause of 30-50 msec between words, when creating sentences, and a pause of 100-200 msec between clauses.

Note: Every utterance must be followed by a pause in order to make the chip stop talking the last allophone.

## TABLE 5 – GUIDELINES FOR USING THE ALLOPHONES

### Silence

- PA1 ( 10 ms) — before BB, DD, GG, and JH
- PA2 ( 30 ms) — before BB, DD, GG, and JH
- PA3 ( 50 ms) — before PP, TT, KK, and CH, and between words
- PA4 (100 ms) — between clauses and sentences
- PA5 (200 ms) — between clauses and sentences

### Short Vowels

- \* /IH/ — sitting, stranded
- \* /EH/ — extent, gentlemen
- \* /AE/ — extract, acting
- \* /UH/ — cookie, full
- \* /AO/ — talking, song
- \* /AX/ — lapel, instruct
- \* /AA/ — pottery, cotton

### Long Vowels

- /IY/ — treat, people, penny
- /EY/ — great, statement, tray
- /AY/ — kite, sky, mighty
- /OY/ — noise, toy, voice
- /UW1/ — after clusters with YY: computer
- /UW2/ — in monosyllabic words: two, food
- /OW/ — zone, close, snow
- /AW/ — sound, mouse, down
- /EL/ — little, angle, gentlemen

### R-Colored Vowels

- /ER1/ — letter, furniture, interrupt
- /ER2/ — monosyllables: bird, fern, burn
- /OR/ — fortune, adorn, store
- /AR/ — farm, alarm, garment
- /YR/ — hear, earring, irresponsible
- /XR/ — hair, declare, stare

### Resonants

- /WW/ — we, warrant, linguist
- /RR1/ — initial position: read, write, x-ray
- /RR2/ — initial clusters: brown, crane, grease
- /LL/ — like, hello, steel
- /YY1/ — clusters: cute, beauty, computer
- /YY2/ — initial position: yes, yarn, yo-yo

### Voiced Fricatives

- /VV/ — vest, prove, even
- /DH1/ — word-initial position: this, then, they
- /DH2/ — word-final and between vowels: bathe, bathing
- /ZZ/ — zoo, phase
- /ZH/ — beige, pleasure

### Voiceless Fricatives

- \* /FF/ —) These may be doubled for initial position and used singly in final position
- \* /TH/ —)
- \* /SS/ —)
- /SH/ — shirt, leash, nation
- /HH1/ — before front vowels: YR, IY, IH, EY, EH, XR, AE
- /HH2/ — before back vowels: UW, UH, OW, OY, AO, OR, AR
- /WH/ — white, whim, twenty

### Voiced Stops

- /BB1/ — final position: rib; between vowels: fibber, in clusters: bleed, brown
- /BB2/ — initial position before a vowel: beast
- /DD1/ — final position: played, end
- /DD2/ — initial position: down; clusters: drain
- /GG1/ — before high front vowels: YR, IY, IH, EY, EH, XR
- /GG2/ — before high back vowels: UW, UH, OW, OY, AX; and clusters: green, glue
- /GG3/ — before low vowels: AE, AW, AY, AR, AA, AO, OR, ER; and medial clusters: anger; and final position: peg

## Voiceless Stops

- /PP/ — pleasure, ample, trip
  - /TT1/ — final clusters before SS: tests its
  - /TT2/ — all other positions: test, street
  - /KK1/ — before front vowels: YR, IY, IH, EY, EH, XR, AY, AE, ER, AX; initial clusters: cute, clown, scream
  - /KK2/ — final position: speak; final clusters: task
  - /KK3/ — before back vowels: UW, UH, OW, OY, OR, AR, AO; initial clusters: crane, quick, clown, scream

## Affricates

- |              |   |
|--------------|---|
| /CH/         | - church, feature   |
| /JH/         | - judge, injure   |
| <b>Nasal</b> |   |
| /MM/         | - milk, alarm, ample  |
| /NN1/        | - before front and central vowels: YR, IY, IH, EY, EH,<br>XR, AE, ER, AX, AW, AY,<br>UW; final clusters: earn |
| /NN2/        | - before back vowels: UH, OW,<br>OY, OR, AR, AA   |
| /NG/         | - string, anger   |

\* These allophones can be doubled.
